C

## HOLD DOWN FOR HIGH TENSILE FORCES

- Hold-down with high tensile strength, for CLT or frame buildings
- Available in 4 sizes to be combined with 3 washers to meet all static performance requirements
- Large rod bore allows for optimum use of concrete fastening

## GENERAL PRINCIPLES

- Characteristic values are consistent with EN 1995-1-1 and in accordance with ETA-11/0086. The design values of the anchors for concrete are calculated in accordance with the respective European Technical Assessments.
- The connection design strength value is obtained from the values on the table as follows:

$$
R_{d}=\min \left\{\begin{array}{l}
\frac{R_{k, \text { timber }} \cdot k_{\text {mod }}}{\gamma_{M}} \\
\frac{R_{k, \text { steel }}}{\gamma_{\text {steel }}} \\
R_{d, \text { concrete }}
\end{array}\right.
$$

- The calculation process used a timber characteristic density of $\rho_{k}=350 \mathrm{~kg} / \mathrm{m}^{3}$ and a $C 25 / 30$ concrete strength class with a thin reinforcing layer, where there is no edge-distance and minimum thickness indicated in the tables.
- Dimensioning and verification of timber and concrete elements must be carried out separately.
- For applications on CLT (Cross Laminated Timber) it is recommended to use nails/screws of adequate length to ensure that the fixing depth involves a sufficient timber thickness to prevent fragile failure for group effects.
- The strength values of the connection system are valid under the calculation hypotheses listed in the table.
- Chemical anchor V-NEX according to ETA-20/0363 with threaded rods (type INA) in minimum steel class 5.8
